Introduction

Who is who?

ANDREAS GROETZ

Oracle DBA Tech Lead

Entain Services Austria GmbH

Entain is one of the world's largest sports betting and gaming groups. Leveraging the power of the Entain Platform, they bring moments of excitement into their customers lives through more than 30 iconic brands such as bwin, Coral, Ladbrokes and many more.

Entain operates on over 140 licenses across 40+ territories and employs over 29,000 talented workforce. Entain is listed on the London Stock Exchange and is a constituent of the FTSE 100 Index.

5 Physical Standby DBs

Local, and in different region, 2500km away

Constraints

Limiting factors, and other things to know

Photo by Mihaly Koles on Unsplash

Up to 15TB redo/day is beyond what Oracle GoldenGate will be able to synch

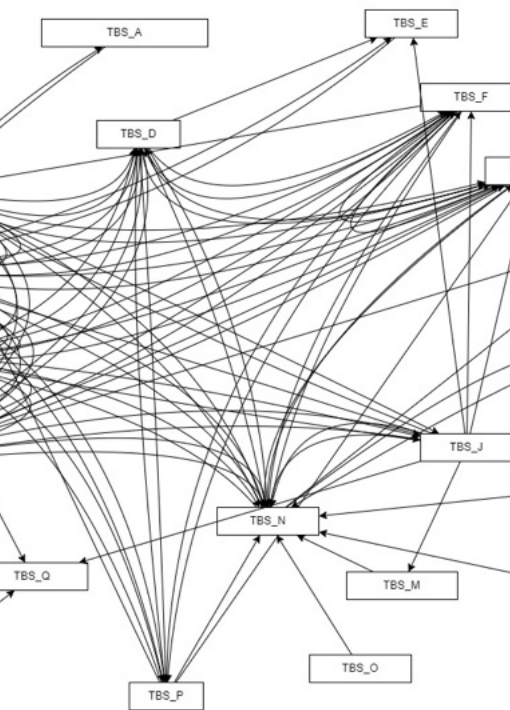

The system is highly active 24 x 7 x 365

Photo by Dave Hoeller on Unsplash

Very large database, very constrained downtime

- 180+TB database size
- 5-6 TB growth/month
- Every minute of downtime costs \$\$\$
 - Users immediately move to competitors

Migrating tablespaces upfront or separately **definitely** not an option

- Way too many cross-dependencies
- Tablespaces aren't isolated

Photo by Linh Ha on Unsplash

Every complex Oracle data type you can imagine is used

- XML binary types
- Nested partitioned tables
- Evolved object types

Photo by [Masaki Komori](#) on [Unsplash](#)

Tight downtime window

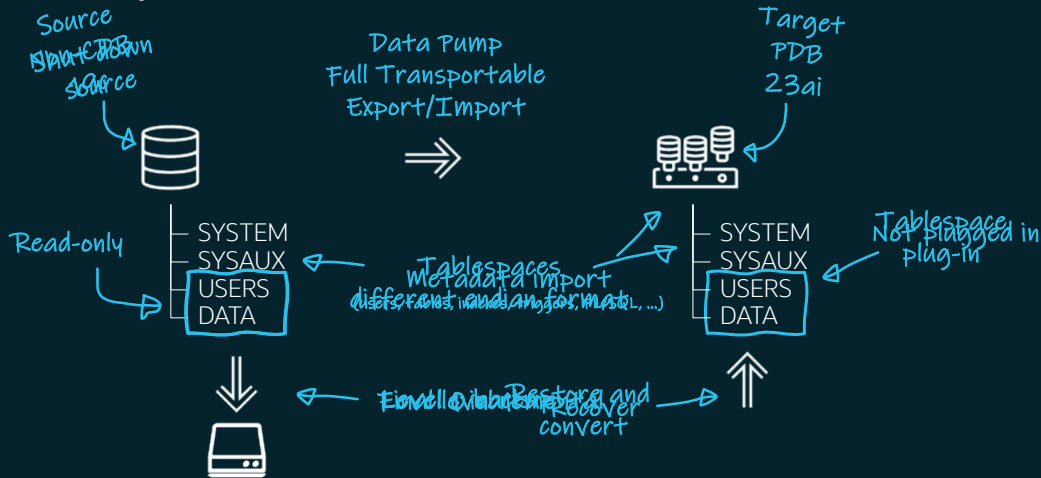

- Dry run: 2 hours outage approved
 - Tablespace read-only
 - Full Transportable Export
- Live migration: 13 hours approved

Migration

Typically, we use **Full Transportable Export/Import** for large cross-endian migrations

Concept

Scripts for Incremental Backup Automation

Backup / restore / recover

- No multisection backups
- No encrypted tablespaces
- Inefficient parallelism
- Incomplete multitenant support

M5 is the **next-generation** cross-platform transportable tablespace procedure

- New RMAN functionality combined with Full Transportable Export/Import
- Doc ID [29991571](#)

M5 Migration Script

The new migrations scripts superseding the V4 PERL scripts

```
# source database
RUN
{
  ALLOCATE CHANNEL d1 DEVICE TYPE DISK FORMAT '...';
  ALLOCATE CHANNEL d2 DEVICE TYPE DISK FORMAT '...';
  BACKUP

    FILESPERSET 1
    SECTION SIZE 64G
    TAG UP19_L0_240206101548
    TABLESPACE <list-of-tablespace>;
}
```

```
# source database
RUN
{
  ALLOCATE CHANNEL d1 DEVICE TYPE DISK FORMAT '...';
  ALLOCATE CHANNEL d2 DEVICE TYPE DISK FORMAT '...';
  BACKUP
    FILESPERSET 1
    SECTION SIZE 64G
    TAG UP19_L0_240206101548
    TABLESPACE <list-of-tablespace>;
}
```

```
# target database
RUN
{
  ALLOCATE CHANNEL DISK1 DEVICE TYPE DISK FORMAT '...';
  ALLOCATE CHANNEL DISK2 DEVICE TYPE DISK FORMAT '...';
  RESTORE ALL FOREIGN DATAFILES TO NEW FROM BACKUPSET
  '<backup-set-1>',
  '<backup-set-2>',
  ...
  '<backup-set-n>'
};
```

Benefits

M5 procedure supports:

- Encrypted tablespaces
- Multisection backups
- Migrating multiple databases into the same CDB simultaneously
- Compressed backup sets
- Better parallelism

Requirements

- Source and target database must
 - be 19.18.0 or higher
 - use Data Pump Bundle Patch

Always use the latest version of M5 script

- Download from Doc ID [29991571](#)

Use Block Change Tracking for faster incremental backups

- Check the License Guide for details

Level 1

Outage

Final
Backup

Final
restore

Export
Import

SPARC
SuperCluster

ZDLRA

Exadata
X9M Extreme Flash

M5 Workflow

- Start final level 1 incremental backup
 - Use driver script `dbmig_driver_m5.sh` [L1F](#)
 - Sets tablespaces read-only
 - Performs level 1 incremental backup
 - Starts Data Pump full transportable export
- Optionally, shuts down source database

M5 Workflow

- Driver script created a restore script
 - Restore using `restore_L1F_<source_sid>_<timestamp>.cmd`
- Check logs

M5 Workflow

SPARC
SuperCluster

ZDLRA

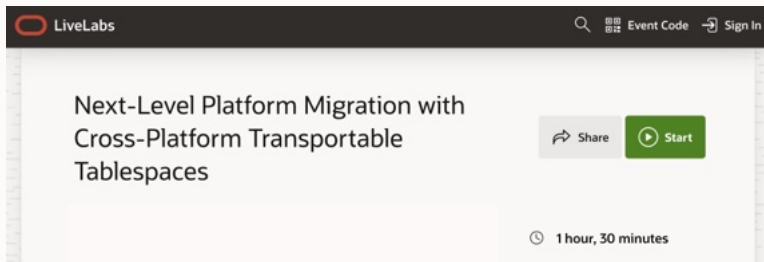

Exadata
X9M Extreme Flash

M5 Workflow

- Copy Data Pump dump file to *DATA_PUMP_DIR*
- Use import driver script in test mode
 - Start `impdp.sh <dump_file> <restore_log> test`
- Check generated parameter file
 - Use `impdp.sh <dump_file> <restore_log> run`
- Check Data Pump log file

The Project Plan

Timelines and the Run Book

Overall Project Timeline

Key to Success: Runbook

Complex projects absolutely require a **detailed runbook**

ID	Task	Status	Responsible Primary Person	Responsible Secondary Person	Predecessor	Start Time (CEST)	Duration (hh:mm)	End Time (CEST)	Start Time (IST)	End Time (IST)	Actual Start Time (CEST)	Actual Duration	Actual End Time (CEST)	Comments - Blocker
----	------	--------	----------------------------------	------------------------------------	-------------	----------------------	---------------------	--------------------	------------------------	-------------------	--------------------------------	--------------------	------------------------------	-----------------------

- This run book covered over 200 individual tasks

A screenshot of a complex project runbook table. The table has many columns, including task ID, task name, status, responsible primary and secondary persons, predecessor, start and end times in CEST and IST, duration, actual start and end times, and comments. The rows are color-coded in green, blue, and yellow, likely representing different task statuses or categories. The table is densely packed with text and numbers, showing a high level of detail for project management.

Issue 1 | Long Running Metadata Import

Fix applied to remedy export errors

- BUG 34201281 - MERGE ON DATABASE RU 19.12.0.0.0 OF 33963454 34052641

Result:

- Now Full Transportable import alone took over 6 days (!!)

```
08-JUN-22 16:21:17.887: W-1 Processing object type DATABASE_EXPORT/.../PROCACT_INSTANCE
14-JUN-22 18:56:58.813: W-1      Completed 108 PROCACT_INSTANCE objects in 527737 seconds
...
14-JUN-22 19:15:50.016: Job "SYSTEM"."SYS_IMPORT_TRANSPORTABLE_01" completed with 316 error(s)
                        at Tue Jun 14 19:15:49 2022 elapsed 6 06:45:38
```

Issue 1 | Long Running Meta Import

Long running action identified via tracing:

```
UPDATE "POSTMAN"."T_MAIL_LOG"  
SET "C_CVAR"=SYS_REMAP_XMLTYPE("C_CVAR")
```

- 300+ million rows

Issue in internal package DBMS_CSX_INT

- Fast merge of XMLTYPE is not happening as expected
 - *Reason:* Incorrect internal check query
- Tokens between source and target are not identical
 - *Reason:* Different Endianness

Issue 1 | Long Running Meta Import

Solution:

- Use workaround from MOS Note: 2309649.1 in UPGRADE mode
 - [MOS Note: 2309649.1 - How to Migrate Large Amount of Binary XML Data between Databases](#)

```
25-JUL-22 12:28:40.813: Job "SYSTEM"."SYS_IMPORT_TRANSPORTABLE_01" completed  
with 317 error(s) at Mon Jul 25 12:28:40 2022 elapsed 0 04:33:03
```

Issue 2 | Metadata API and Nested Tables

Full transportable import errors out for a **nested partitioned table**

```
PLS-00172: string literal too long
```

```
ORA-39151: Table "DBA_XY"."X_GAMES" exists.
```

```
All dependent metadata and data will be skipped due to table_exists_action
```

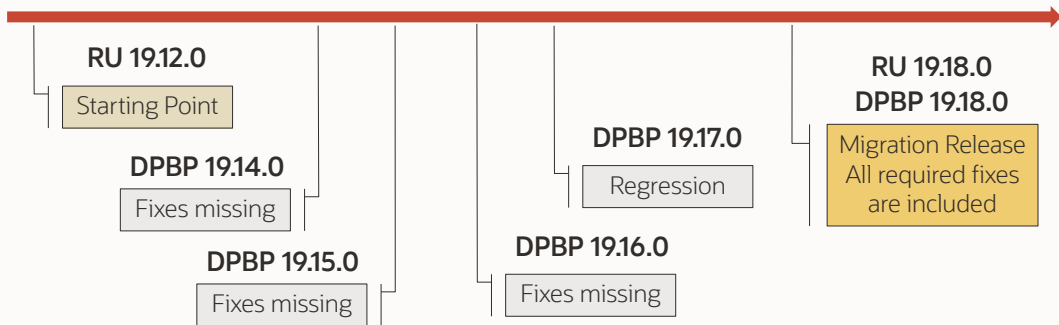

Root cause was a string overflow in the Metadata API

- Data Pump creates the index, and then alters it – here the overflow happened
- Side effect was a misleading error message

Issue 3 | Data Pump Bundle Patch

Many of the TTS and Metadata fixes got included into Data Pump Bundle

- [Data Pump Recommended Proactive Patches For 19.10 and Above \(Doc ID 2819284.1\)](#)

Issue 4 | Evolved Object Types

Evolved TYPES can lead to Data Pump errors during transportable import:

```
ORA-39083: Object type TABLE:"APPUSER"."CARS" failed to create with error:  
ORA-39218: type check on object type "APPUSER"."CAR_TYPE" failed  
ORA-39216: object type "APPUSER"."CAR_TYPE" hashcode or version number mismatch
```

Further Information:

- [Blog Post: Understand why Data Pump errors with evolved types](#)

Using evolved types in table definitions

--Create a new type. The type is now version 1

--Use the type in a table

```
CREATE TYPE CAR_INFO_TYPE IS OBJECT (model VARCHAR2(40));
```

```
CREATE TABLE CARS (id number, car_info car_info_type);
```

```
INSERT INTO CARS VALUES (1, car_info_type('Volvo V90'));
```

The type is now evolving

--Make a change to the type. The type is now version 2

```
ALTER TYPE CAR_INFO_TYPE ADD ATTRIBUTE horsepower NUMBER CASCADE NOT INCLUDING TABLE DATA;
```

```
INSERT INTO CARS VALUES (2, car_info_type('BMW 530i', 250));
```

Existing data is not updated

--Make another change to the type. The type is now version 3

```
ALTER TYPE CAR_INFO_TYPE ADD ATTRIBUTE color VARCHAR2(20) CASCADE NOT INCLUDING TABLE DATA;
```

```
INSERT INTO CARS VALUES (3, car_info_type('Hyundai Sonata', 160, 'Black'));
```

Evolved Types

```
SELECT * FROM CARS
```

CARS	
1	car_info_type v1: Volvo V90
2	car_info_type v2: BMW 530i, 250
3	car_info_type v3: Hyundai Sonata, 160, Black

DICTIONARY	
car_info_type v1	model
car_info_type v2	model, horsepower
car_info_type v3	model, horsepower, color

Data Pump recreates types during
Full Transportable Export/Import

Evolved Types

- To avoid **data corruption**,
Data Pump must recreate the exact same type evolution in target database
- Due to **implementation restrictions**,
it is not always possible to recreate the exact same type evolution
- In such situations, to avoid corruption,
Data Pump reports ORA-39218 or ORA-39216 on **import**

Evolved Types | Possible Solutions

- 1 Conventional Data Pump export
- 2 Manually recreate `type` in target database with matching evolution
- 3 Recreate `type` without evolution before export

[Blog post](#) with details

Issue 5 | Advanced Queueing

Source database

`<queue_table_name>`
`AQ$_<queue_table_name>_E`
`AQ$_<queue_table_name>_I`
`AQ$_<queue_table_name>_T`
`AQ$_<queue_table_name>_F`
`AQ$_<queue_table_name>_C`
`AQ$_<queue_table_name>_D`
`AQ$_<queue_table_name>_G`
`AQ$_<queue_table_name>_H`
`AQ$_<queue_table_name>_L`
`AQ$_<queue_table_name>_P`
`AQ$_<queue_table_name>_S`
`AQ$_<queue_table_name>_V`

Queue table

Queue
infrastructure

Target database

`<queue_table_name>`
`AQ$_<queue_table_name>_E`
`AQ$_<queue_table_name>_I`
`AQ$_<queue_table_name>_T`
`AQ$_<queue_table_name>_F`

Issue 5 | Advanced Queueing

Queue tables and underlying objects may change during import

- COMPATIBLE **during creation** of queue tables matters
- COMPATIBLE **during import** matters as well
- [MOS Note: 2291530.1 - Understanding How AQ Objects Are Exported And Imported](#)
- [Blog post: Changing data types in queue tables during import](#)

Options:

- Recreate the queue tables with "old" COMPATIBLE setting
- Benefit from new COMPATIBLE setting and test the application

Take into account when comparing source and target databases' object count

- Understanding How Advanced Queueing (AQ) Objects Are Exported And Imported (Doc ID [2291530.1](#))

Data Pump does not start queues

- Manually start queues after migration
- Use `DBMS_AQADM.START_QUEUE`

Issue 6 | Default Tablespaces

Due to a security fix export wants to write into the user's default tablespace

- Bug 27692190
- But default tablespaces are read-only while full transportable export runs

Workaround:

- Change default tablespace for all users to SYSTEM
- Full Transportable Export
- Full Transportable Import
- Revert default tablespaces back to original in target (and source)

Issue 7 | Exporting Statistics

Exporting statistics is slow using
`DBMS_STATS.EXPORT_SCHEMA_STATS`

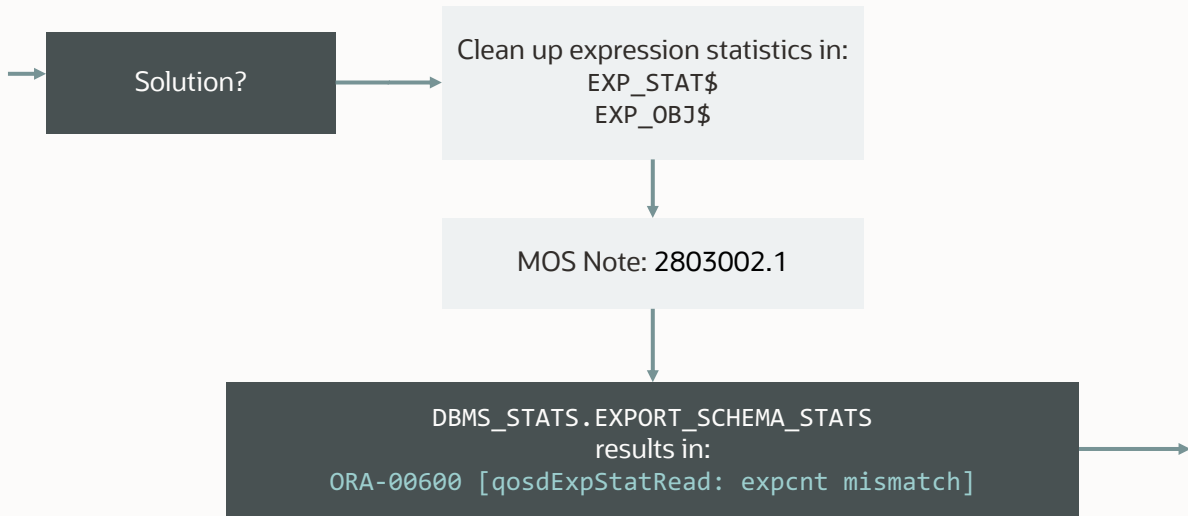

10046 trace reveals long runtime on:
`EXP_STAT$`
`EXP_OBJ$`

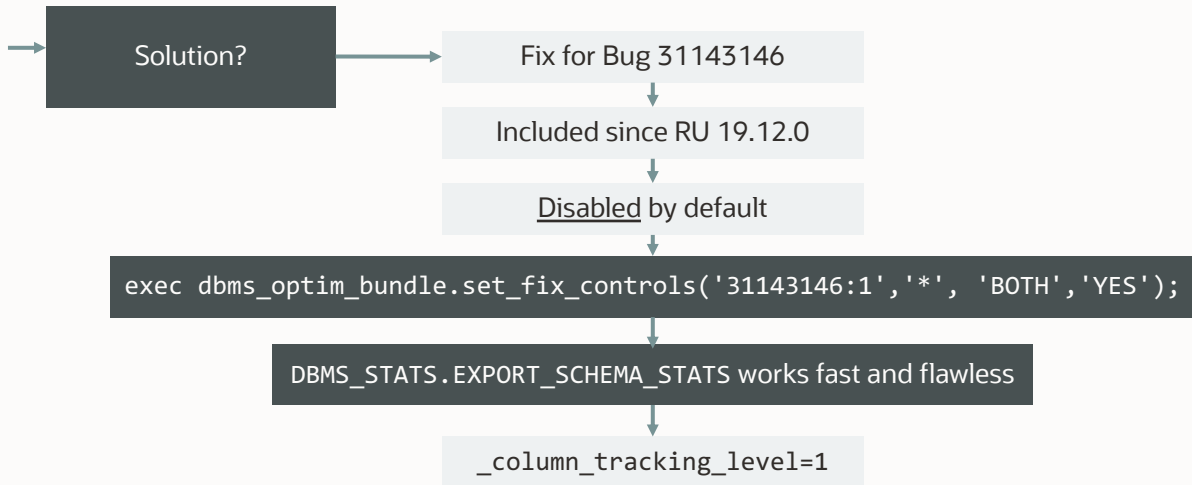

Expression Statistics for Auto-Indexing

Default: `_column_tracking_level=53;`

Issue 7 | Exporting Statistics

Issue 7 | Exporting Statistics

Issue 8 | Auditing

Tablespaces containing auditing tables **can't be set read-only**

Data Pump always unloads the audit records into the dump file

- Huge audit trail will lead to a huge dump file and longer outage

Options:

- Export audit records, and eventually import them afterwards
- Archive audit records, purge the audit trail

Thank You
